SCADA: SUPERVISORY CONTROL AND DATA ACQUISITION

Supervisory control and data acquisition (SCADA) is a system of software and hardware elements that allows organizations to control and monitor industrial, municipal, and processes by directly interfacing with plant-floor machinery and viewing real-time data.

Since the mid-1970s, the term SCADA has emerged to describe municipal and industrial control systems. At that time, the systems were isolated and siloed. With the Cornell Co-Pilot Gateway, integration, information flow, and control flow across your organization leading to better understanding, execution, and efficiency.

With a SCADA system, municipal and industrial organizations can:

- Monitor, gather, process, and analyze real-time data
- Control processes locally or remotely
- Directly manage devices such as valves, switches, and motors
- Record activities, events, and upset conditions to logs
